1	<i>BSTOP</i> and <i>BSPL</i> and stuff	2
2	Where is the cobordism bro	2

1 *BSTOP* and *BSPL* and stuff

Since we are at an odd prime $BSTOP \simeq BSPL$.

$BSTOP \simeq BSO \times B(\text{coker } J)$; what is J ? Then the Thom spectra satisfy $MSTOP \simeq MSO \wedge M(\text{coker } J)$.

A exterior algebra generated by Milnor primitive elements?

2 Where is the cobordism bro

Theorem 2.1 (13.1). Let $f: M \rightarrow C$ be a smooth singular (?) n -manifold with bordism class $[M, f] \in \tilde{\Omega}_*(C)$. Then there exists a PL manifold Σ such that the Hurewicz image of the cobordism class of Σ is congruent modulo the ideal generated by $\tilde{H}_*(MSO)$ (in what ring?) to the image of $[M, f]$ under the composite

$$\tilde{\Omega}_*(C) \xrightarrow{h} \tilde{H}_*(C) \xrightarrow{\sigma_*} H_*(BC) \subseteq H_*(BPL) \xrightarrow{\phi} H_*(MSPL).$$
